

YOUTUBE TRENDING VIDEOS: AUGUST 2026

1. PROJECT BACKGROUND AND DESCRIPTION

This project uses the YouTube Data API to collect global trending video data for August 2026 and leverages Python and Power BI to analyze content trends, audience engagement, and top-performing videos, channels, and categories.

2. DATASET SUMMARY

The dataset was collected using the YouTube Data API and contains information on global trending videos throughout August 2026, including video details, channel information, category, publish date, country, views, likes, comments, and other engagement metrics used for trend and performance analysis.

3. DATA EXTRACTION PROCESS USING PYTHON AND TMDb API

➤ ENABLE THE YOUTUBE DATA API

A project was created in Google Cloud Console, where the YouTube Data API v3 was enabled and an API key was generated to authenticate requests.

➤ IMPORT REQUIRED LIBRARIES

Python libraries such as **googleapiclient.discovery** and **pandas** were imported to connect to the API, retrieve data, and organize it into a structured format.

➤ ESTABLISH API CONNECTION

A connection to the YouTube Data API was established using the generated API key and the `build()` function provided by the Google API Client library.

➤ RETRIEVE TRENDING VIDEOS

API requests were made using the `videos().list()` endpoint with the `chart="mostPopular"` parameter to fetch trending videos. Relevant details such as video title, channel name, category ID, publish date, view count, like count, comment count, duration, and tags were requested.

➤ COLLECT DATA THROUGHOUT AUGUST

The extraction process was executed daily throughout August 2026 to capture the changing list of trending videos. The daily datasets were then combined into a single dataset representing the entire month's trending activity.

➤ TRANSFORM AND ORGANIZE THE DATA

The JSON response returned by the API was parsed using Python, and the required fields were extracted and stored in a structured Pandas DataFrame.

➤ EXPORT THE DATASET

The cleaned and structured dataset was exported as a CSV file, making it suitable for further data cleaning, transformation, and visualization in Power BI.

4. DATA VISUALIZATION IN POWER BI

5. FINAL OBSERVATIONS

- The analysis of YouTube trending videos throughout August 2026 revealed that Music was the dominant content category, accounting for nearly half of all trending videos, followed by Entertainment and Gaming.
- A small number of videos generated exceptionally high view counts, indicating that audience attention was concentrated around a few highly popular releases during the month.
- MrBeast Gaming** emerged as the top-performing channel based on total views, highlighting the strong influence of established creators on YouTube's trending ecosystem.
- The trailer for **"Avengers: Doomsday"** ranked as the most viewed trending video, while the list of most-liked videos showed a similar concentration of audience engagement among blockbuster releases.
- Overall, the project highlights how data collected through the YouTube Data API and analyzed using Python and Power BI can provide valuable insights into global content trends, creator performance, and audience preferences.
